LETTER OF TRANSMITTAL.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,

Washington, D. C., January 12, 1898.

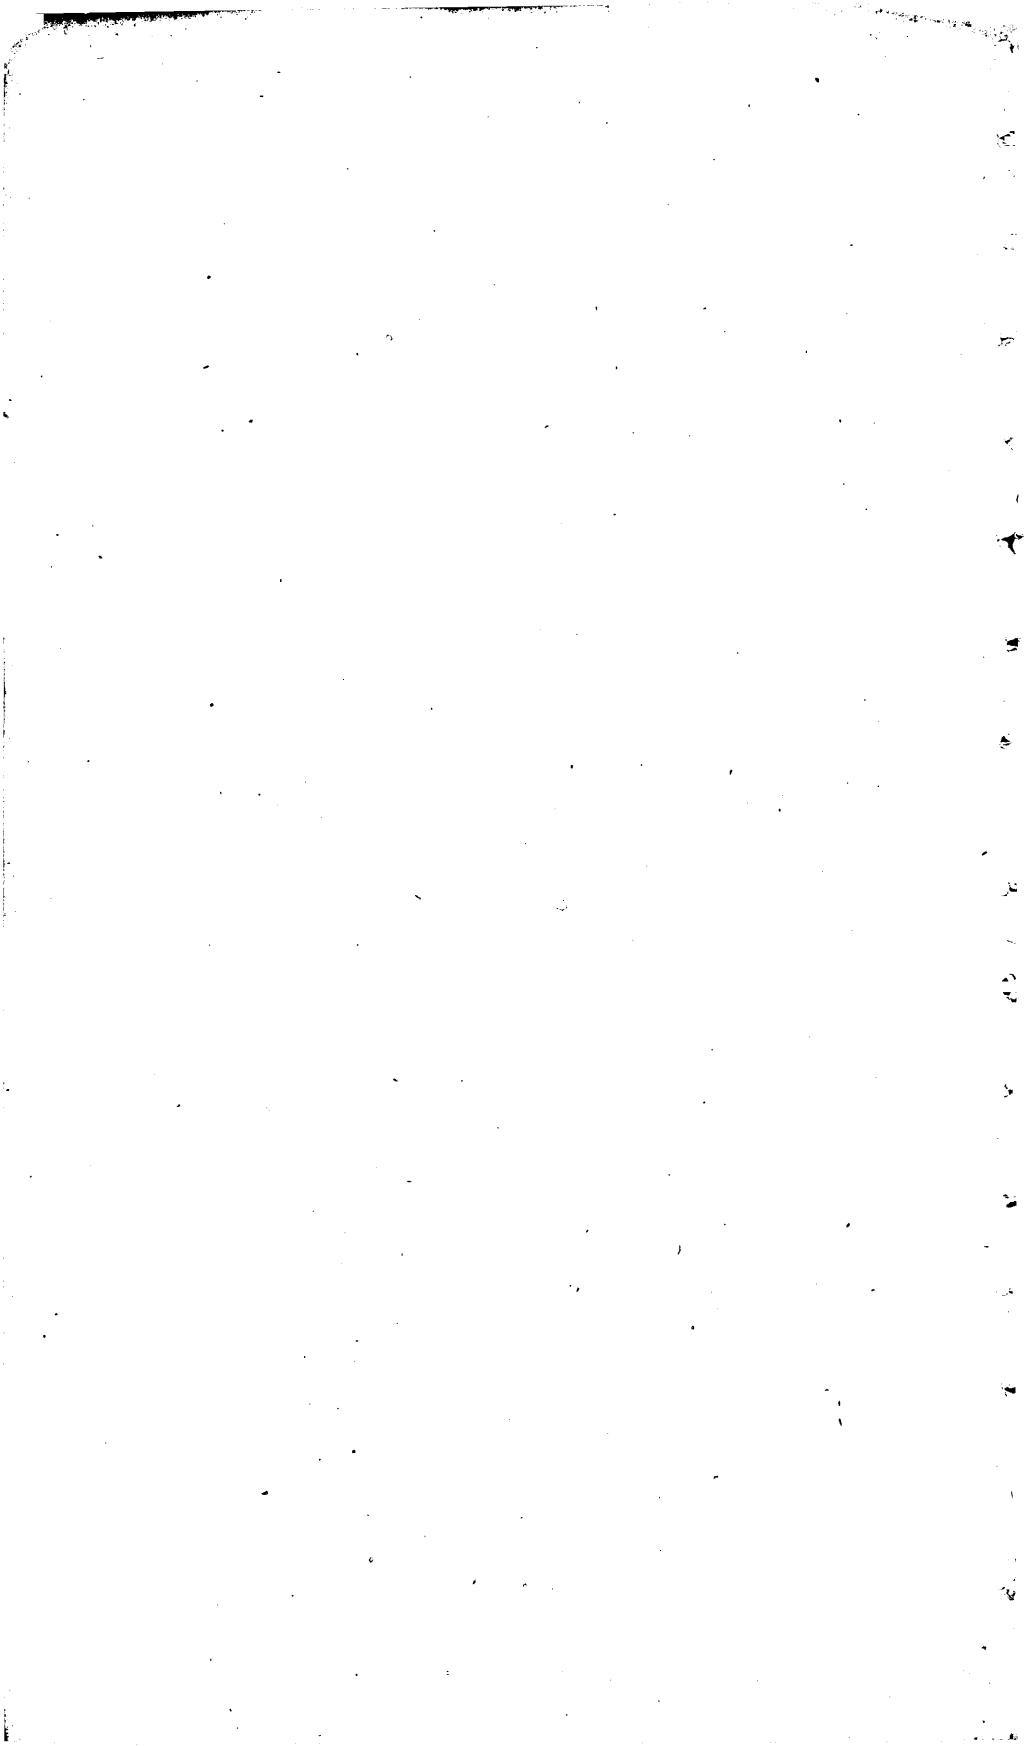

SIR: I have the honor to transmit herewith the manuscript of a catalogue of the Cretaceous and Tertiary plants of North America, and to request its publication as a bulletin of the Survey.

Very respectfully, yours,

F. H. KNOWLTON,
Assistant Paleontologist.

Hon. CHARLES D. WALCOTT,

Director United States Geological Survey.

A CATALOGUE OF THE CRETACEOUS AND TER- TIARY PLANTS OF NORTH AMERICA.

By F. H. KNOWLTON.

INTRODUCTION.

This catalogue of the Cretaceous and Tertiary plants of North America is the outcome of the author's personal needs, and is presented, even in its present somewhat imperfect form, in the hope that it may be of assistance to other workers in this field.

The first catalogue of approximately this scope was published by Prof. Leo Lesquereux in the Tenth Annual Report of the United States Geological and Geographical Survey of the Territories¹ under the title Catalogue of the Cretaceous and Tertiary Plants of North America, with References to the Descriptions. In this catalogue the species are arranged in botanical sequence. The Cretaceous flora embraced only 157 species and the Tertiary flora 549 species, or a total of 706 for these two great geological systems. As a proof of the rapid growth of paleobotanical knowledge in this country during the twenty-one years between that and the present enumeration, it may be stated that the Potomac flora alone now numbers more species than the total Cretaceous and Tertiary floras known to Lesquereux, and that the flora of the Dakota group has more than twice as many species (460) as the whole Cretaceous had, as then known.

The only other catalogue is that of S. A. Miller, published in 1881 under the title North American Mesozoic and Cœnozoic Geology and Palæontology; or, An Abridged History of Our Knowledge of the Triassic, Jurassic, Cretaceous, and Tertiary Formations of this Continent. This is hardly more than a crude compilation from that of Lesquereux and certain publications that had appeared between the date of that and the year 1881.

A number of lists without references or synonymy have been published which embrace simply the names and in some cases the distribution of the species—such, for example, as Lesquereux's "Table of distribution of the species of fossil plants in the Tertiary formations

¹ Washington, 1870 [1878], pp. 487-520.

of North America;"¹ a list under the same title in the following volume;² a "Table showing the geographical distribution of the fossils of the Laramie group, collected during the season of 1877;"³ "A table of distribution of the plants of the Cretaceous Cenomanian formation,"⁴ "Table of distribution of the species of the Laramie group;"⁵ "Table of distribution of the plants of the Green River and White River group,"⁶ "Table of distribution of North American Miocene fossil plants;"⁷ "Table showing the distribution of the plants of the Dakota group;"⁸ Lester F. Ward: "Table of distribution of Laramie, Senonian, and Eocene plants,"⁹ etc.

In the present catalogue the entire flora is arranged in a single alphabetical sequence. This arrangement precludes the duplication of species which may occur in more than one formation, and is, moreover, easier of use than when the species are arranged according to botanical affinities.

I have given for each genus the original date and place of publication. In the case of the exclusively fossil genera much care has been expended in verifying these points, and while it is too much to expect that all are absolutely correct, it is hoped that the errors will prove to be few. For the living genera that have also been found fossil, the date and place of publication have been taken mainly from the Kew Index and have not in all cases been verified. The dates of these later genera are not, however, of great importance in the present connection, since botanists are not agreed as to the date that shall be taken as the initial point for genera. One school would make the introduction of binomial nomenclature, or the publication of Linnaeus's *Species Plantarum*, 1753, as the initial point for both genera and species, while another school would take the publication of Linnaeus's *Systema*, in 1735, as the starting point for genera. Other botanists would go still further back to Tournefort, who has been called the father of genera, or even to the remote place in literature when a genus was first printed, no matter in what connection. It would seem wise, therefore, to settle on some important date as the initial point. For convenience the date selected in the Kew Index—1735—is here taken for the living genera. Fortunately the science of paleobotany is so young that all of the generic names that have been given in it are of later date than any of the dates in controversy, since all are later than 1800.

In the case of species, the original place and date of publication have been given in all instances. This is followed by several of the most important references, especially such as refer to descriptions and fig-

ures, but no attempt has been made to make it absolutely complete, since to have done this would have greatly increased the labor of compilation without adding much to its value as a catalogue. The original and, for sake of convenience, most important references are given.

When the species is a foreign one the original reference is given, followed by a reference to the first place where it is recorded as belonging to our flora. Then follow the references to figures and descriptions, if there be any, relating to its North American history.

The synonymy is placed in proper order under the species to which it belongs. Each synonym is, however, entered in its proper alphabetical place, followed by an indication of the form to which it is now referred. Thus: "*Ficus ? fimbriata Lx.=Eremophyllum fimbriatum.*"

In the numerous reports on fossil plants published in the Annual Reports of the Hayden Survey, Lesquereux described many species supposed to be new to science, and also identified numerous foreign species, that were never afterwards alluded to by him. There are probably more than 100 species coming under this heading that are not entitled to recognition as belonging to our flora. These new or foreign species were described or identified from time to time in these preliminary reports, but when Lesquereux came to study them more carefully, in preparing them for the final monographs, they were discarded or merged into other species, and no record was made of such disposition. They stand, therefore, in the books as valid species, while in reality they are hardly more than nomina nuda. The specimens upon which they were based are now lost or embraced under other names in such a way that there is absolutely no connection between them. In the following catalogue these species have been indicated by a bracketed statement at the end. Thus: "*Quercus Goldianus Lx., Ann. Rept. U. S. Geol. and Geogr. Surv. Terr., p. 398 (1873 [1874]).* [Not recognized by its author after first description.]"

No attempt has been made in this catalogue to give an absolutely complete account of the geographical distribution of the various species. It would have required a monographic revision of each species to determine accurately its areal distribution, and such a work was not contemplated at the present time. The distribution here given is taken mainly from the books, with little or no revision, and while it is undoubtedly correct in a large majority of cases, it is not to be taken as absolutely so. One of the tasks of the future will be to work out more completely the geographical distribution of our flora.

In similar manner, the geological distribution as here given is not to be taken as final. It is compiled from the books in most cases, and while it has been given as completely and as accurately as was possible under the circumstances, it is constantly changing to accord with the changes in the conception of the various geological horizons. As an example, the plant-bearing horizon at Point of Rocks, Wyoming, had always been referred to the true Laramie, until it was found, in 1896,¹

¹ See Stanton and Knowlton: Bull. Geol. Soc. Am., Vol. VIII, pp. 127-156.

that it was below well-defined marine Cretaceous, and hence in the Montana formation.

Another source of uncertainty results from the disagreement among geologists and paleontologists as to the age of various beds. Thus, by some the Fort Union beds are regarded as Cretaceous and by others as Tertiary, and the so-called "Arctic Miocene" is coming to be regarded as Eocene. When it has been possible, without circumlocution, the horizon has been indicated in a way that will fix its relative position without going too far. Thus the use of the Belly River series, Denver beds, Fort Union beds, Amboy clays, Potomac formation, etc., indicates sufficiently the geological position, without attempting a discrimination perhaps unwarranted by the present state of our knowledge. But above all it should be remembered that this is an attempt at a catalogue of our Cretaceous and Tertiary plants, and is not intended as a complete exposition of their geographical or geological distribution.

No arbitrary signs or characters have been used in this work. In a few cases it was found necessary to give new names on account of the old name being preoccupied. In such cases the new name is followed by "nom. nov." In accordance with principles quite generally adopted among recent botanists, the attempt is made in this catalogue to restore the oldest specific name under which a species was described. This has resulted in a number of new combinations, which are indicated by the abbreviation "n. comb." In the case of two dates given for a publication (e. g., Fl. Amboy Clays, 1895 [1896]) the first is the title-page date, the bracketed date being the actual date of issue.

The bibliography consists simply of a list of the North American works and papers that have been consulted in preparing this catalogue, together with such others as contain original descriptions of our plants. It was not thought worth while to give a bibliography of the references to the numerous foreign species that have been identified in our flora, with the single exception of those found in the various parts of Heer's *Flora Fossilis Arctica*.

In conclusion, I beg to acknowledge my indebtedness to Prof. Lester F. Ward for valuable suggestions, use of books, etc., and to his assistant, Miss C. H. Schmidt, for assistance in cataloguing and verifying references.
